

HireSense AI

A RAG-Powered Talent Intelligence Platform for HR

April 10, 2026

Waleed El-Jack | Kristofor Figueiredo | Kevin Ordet | Jamie Shook

What Will We Build?

HireSense AI is an internal HR tool that helps match candidates to roles more effectively. It uses a RAG-based approach to pull in job descriptions and resumes, then finds the best matches based on actual skills and experience, not just keywords. On top of that, it uses large language models (LLMs) to generate structured insights like candidate scores, strengths/weaknesses, reasoning behind the match, and even interview questions. Overall, it is meant to give recruiters a clearer, more data-driven way to evaluate candidates.

Why?

Traditional recruiting tools rely on keyword filtering, which misses qualified candidates and wastes recruiter time. HR teams lack transparent, data-driven reasoning behind candidate rankings. HireSense AI addresses this by providing explainable, semantic matching to surface the best talent while giving recruiters clear justifications for every recommendation, making the hiring process faster, fairer, and more effective.

Industry Relevance

The HR technology market is rapidly adopting AI to solve persistent hiring inefficiencies. Companies lose competitive advantage through slow, inconsistent hiring. HireSense AI directly addresses talent acquisition in a multi-billion dollar industry by applying state-of-the-art NLP and RAG techniques to a real, high-stakes business problem. Its internal deployment model ensures data privacy, a critical requirement for enterprise HR departments.

Project Plan, Components & Milestones

- Milestone 1: Build the data pipeline by collecting and preprocessing job descriptions and resumes, and setting up a vector database with an embedding model.
- Milestone 2: Develop the RAG-based retrieval system to identify the most relevant candidates for a given job description.
- Milestone 3: Integrate the LLM scoring component to generate structured evaluations, including strengths, weaknesses, and justifications.
- Milestone 4: Design and implement a dashboard interface for recruiters to upload job descriptions and review results.
- Milestone 5: Evaluate system performance, refine outputs, and prepare the final demonstration.

What Will the Final Product Look Like?

A web-based HR dashboard where recruiters can upload a job description and receive a ranked list of candidates with explainable AI scores, skill gap summaries, and suggested interview questions. The interface will be clean, intuitive, and designed for non-technical HR users.

Team Responsibilities

- Waleed El-Jack – Data pipeline, vector database setup, and embedding model integration.
- Kevin Ordet – RAG retrieval architecture and LLM prompt engineering.
- Kristofor Figueiredo– LLM scoring engine, output structuring, and skill gap analysis.
- Jamie Shook – Frontend dashboard UI/UX design, system evaluation, and final demo preparation.
